

Exporting

(1): Read SPDX information from DB

(2): Create SPDX File in JSON format. The reason we choose JSON because data stored in CouchDB is also JSON, it will minimize the processing time and effort to implement.

(3): Convert the SPDX File to other formats, depend on the request of user, by using the current SPDX Library.

If we aim to create a SPDX File without File Information, there will be no problem because the file size is small.

In case we aim to create a SPDX File with File Information, no matter what the solution is, the speed will be low, because just creating a file ~100MB itself consumes a lot of time.
